CHAPTER 6 Ratios, Rates, and Proportions

6-1 Ratios and Rates

A ratio is a comparison of two quantities by division.

The ratio of a to b can be written in three different ways: a to b, a:b, and $\frac{a}{b}$.

If two quantities are in the ratio of a to b, then the two numbers can be expressed as ax and bx, in which x is a positive integer.

A rate is a ratio of two measurements having different units of measure. For example, a price of \$2.59 per gallon of gasoline, an income of \$750 in 3 days, and a speed of 60 miles per hour are all rates.

A unit rate is a rate that has a denominator of 1. Some examples of unit rates are defined as follows.

Price of Package Unit Price = $\frac{1}{\text{Number of Units in the Package}}$

$$Gas Mileage = \frac{Number of Miles Traveled}{Number of Gallons of Gas Used}$$

Speed (Miles per Hour) = $\frac{\text{Number of Miles Traveled}}{\text{Number of Miles Traveled}}$

Number of Hours

Density = $\frac{\text{Mass}}{\text{Volume}}$

Example 1 \square Express each ratio as a unit rate. a. 1360 grams of coffee cost \$17.68. What is the unit price of the coffee? b. A car travels 322 miles on 11.5 gallons of gas. What is the car's gas mileage? c. A driver traveled $485\frac{1}{3}$ miles in $8\frac{2}{3}$ hours. What is his speed?

d. A volume of 46 cm³ of silver has a mass of 483 grams. What is the density of silver?

Solution
a.
$$\frac{\$17.68}{1360 \text{ grams}} = \frac{1768 \text{ cents}}{1360 \text{ grams}} = 1.3 \text{ cents / gram}$$

b. $\frac{322 \text{ mi}}{11.5 \text{ gal}} = 28 \text{ miles / gallon}$.
c. $\frac{485\frac{1}{3} \text{ mi}}{8\frac{2}{3} \text{ hr}} = \frac{(485\frac{1}{3} \text{ mi}) \cdot 3}{(8\frac{2}{3} \text{ hr}) \cdot 3} = \frac{1456 \text{ mi}}{26 \text{ hr}} = 56 \text{ mph}$
d. density $= \frac{\text{mass}}{\text{volume}} = \frac{483 \text{ grams}}{46 \text{ cm}^3} = 10.5 \text{ grams/cm}^3$

Example 2 \Box 3 angles of a triangle are in the ratio of 3:5:7. What is the measure of each angle?

 \Box The measure of each angle of the triangle can be represented as 3x, 5x, and 7x. Solution 3x + 5x + 7x = 180The angle sum in a triangle is 180. 15x = 180Simplify. x = 12Simplify. The measure of the 3 angles are $3x = 3 \cdot 12 = 36$, $5x = 5 \cdot 12 = 60$, and $7x = 7 \cdot 12 = 84$.

Exercises - Ratios and Rates

1	4
The ratio of $1\frac{3}{4}$ to $2\frac{1}{2}$ is equal to the ratio of 14 to what number?	The ratio of length to width of a rectangular garden is 6:7. If the perimeter of the rectangle is 78 meters, what is the area of the garden in square meters?
A) 18	A) 274
B) 20	B) 326
C) 22	C) 352
D) 24	D) 378
2	5
The sum of two numbers is 14 and the ratio of the two numbers is -3 . What is the product of the two numbers?	A car travels 218.5 miles on 9.5 gallons of gas. What is the car's gas mileage?
A) -105	
B) -119	
C) -133	
D) -147	6
	At a grocery store, 20 fl oz of brand <i>A</i> vitamin water is sold for \$0.95. What is the unit price of
3	the vitamin water per ounce, to the nearest cents?
If $2(x-y) = 3y$, what is the ratio $\frac{x}{y}$?	
A) $\frac{2}{5}$	
B) $\frac{4}{3}$	
C) $\frac{5}{2}$	The density of aluminum is 2.7 grams per cm ³ . How many grams does 12 cm ³ of aluminum weigh?
D) $\frac{8}{3}$	

6-2 Proportions

A **proportion** is an equation stating that two ratios are equal.

The proportions $\frac{a}{b} = \frac{c}{d}$ is read "*a* is to *b* as *c* is to *d*." The numbers *a* and *d* are called the **extremes** of the proportion. The numbers *b* and *c* are called the **means** of the proportion. In a proportion, the product of the extremes is equal to the product of the means.

If $\frac{a}{b} = \frac{c}{d}$, then ad = bc. The products ad and bc are called the **cross products** of the proportion $\frac{a}{b} = \frac{c}{d}$.

Example 1 Determine whether each pair of ratios forms a proportion.

a.
$$\frac{0.4}{1.5}$$
, $\frac{1.6}{6}$
Solution \square a. $\frac{0.4}{1.5} \stackrel{?}{=} \frac{1.6}{6}$
 $0.4 \times 6 \stackrel{?}{=} 1.5 \times 1.6$
 $2.4 = 2.4$
The cross products are equal, so the ratios form a proportion.

b. $\frac{12}{25} = \frac{7}{15}$	Write a proportion.
$12 \times 15 \stackrel{?}{=} 25 \times 7$ $180 \neq 175$	Find the cross products. Simplify.

The cross products are not equal, so the ratios do not form a proportion.

Example 2 \square Solve the proportion $\frac{3}{7} = \frac{6}{x-4}$.

Solution	$\Box \frac{3}{7} = \frac{6}{x-4}$	
	3(x-4) = 7(6)	Find the cross products.
	3x - 12 = 42	Distributive Property
	3x = 54	Add 12 to each side.
	x = 18	Divide each side by 3.

Example 3 Carter's SUV requires 8 gallons of gasoline to travel 148 miles. How much gasoline, to the nearest gallon, will he need for a 500 mile trip?

Solution \Box a. Let g = the number of gallons of gas needed for a 500 mile trip.

miles $\rightarrow \frac{148}{2} = \frac{500}{2}$ \leftarrow miles	Write a proportion.
gallons $\rightarrow 8$ $g \leftarrow$ gallons 148 $g = 8 \times 500$	Find the cross products.
8	Find the cross products.
$g = \frac{8 \times 500}{148} \approx 27.03$	Divide each side by 148.

Carter's needs 27 gallons of gas for a 500 mile trip.

Exercises - Proportions

1	4
On a map, 1 inch represents 5 miles. If a certain state is represented on a map by a rectangle 10 inches by 7.2 inches, what is the area of the state in square miles?	If Andy drove 84 miles in 1 hour 45 minutes, how many miles can he drive in 5 hours?
A) 360 mi ²	
B) 720 mi ²	
C) 1,080 mi ²	
D) 1,800 mi ²	5 A collection of quarters, dimes, and nickels is worth \$5.00. If the ratio of quarters to dimes to nickels is 2:4:7, how many quarters are there?
2	
Together there are 754 students and teachers in the meeting. If the ratio of students to teachers is $27:2$, how many teachers are there?	
A) 46	
B) 52	6
C) 58	If $\frac{5x}{3} = \frac{x+14}{2}$, what is the value of x?
D) 64	$\frac{1}{3} = \frac{1}{2}$, what is the value of x?
3	
Concrete is made by mixing cement, sand, and gravel in the ratio $5:9:13$. How much cement is needed to make 324 ft ³ of concrete?	
A) 54 ft ³	A trail mix contains raisin, peanut, and chocolate.
B) 60 ft^3	The ratio of raisin to peanut is $2:3$ and the ratio of peanut to chocolate is $5:8$. What is the ratio
C) 84 ft ³	of raisin to chocolate?
D) 108 ft ³	

6-3 Ratios, Rates, and Proportions Word Problems

You can use conversion factors to convert a unit of measure from one system to another. Sometimes you may need to use two or more conversion factors.

Example 1 \square A model car is scaled so that 1 inch of the model equals 6 feet of the actual car. If the model is $1\frac{2}{3}$ inch long, how long is the actual car?

Solution \Box Let x = the length of actual car.

 $\begin{array}{l} \text{model} \rightarrow \underbrace{1 \text{ in}}_{\text{actual}} \rightarrow \frac{1 \frac{1}{3} \text{ in}}{6 \text{ ft}} = \frac{1 \frac{2}{3} \text{ in}}{x \text{ ft}} \leftarrow \text{model} \\ \leftarrow \text{ actual} \end{array} \qquad \text{Set up a proportion.}$ $x = 6 \times 1 \frac{2}{3} = 10 \qquad \text{Cross product}$

The length of the actual car is 10 feet.

Example 2 \Box A car is traveling at a constant rate of 54 miles per hour. How many kilometers will the car travel in 5 minutes? (1 mile = 1.6 kilometers)

Solution	54 miles = 54 mi $\times \frac{1.6 \text{ km}}{1 \text{ mi}}$ = 86.4 km	
	$\frac{54 \text{ mi}}{1 \text{ hr}} = \frac{86.4 \text{ km}}{60 \text{ min}}$	54 miles = 86.4 km and 1 hour = 60 min
	$\frac{86.4 \text{ km}}{60 \text{ min}} = \frac{x \text{ km}}{5 \text{ min}}$	Set up a proportion.
	$86.4 \times 5 = 60x$	Cross Products
	$x = \frac{86.4 \times 5}{60}$	Divide.
	= 7.2 km	

Example 3 \Box The ratio of males to females in an office is 6:7. If there are 42 males in the office, what is the total number of people in the office?

Solution Let f = the number of females in the office. male $\rightarrow \frac{6}{7} = \frac{42}{f}$ $6f = 7 \cdot 42 = 294$ $f = \frac{294}{6} = 49$ The total number of people in the office is

42 + 49, or 91.

Exercises - Ratios, Rates, and Proportions Word Problems

1

If 20 machines produce 1,240 printers in a day, how many more machines are needed to produce 1,984 printers in a day?

A) 12

- B) 20
- C) 24
- D) 32

2

If $\frac{3}{4}$ quart of lemonade concentrate is mixed with

 $6\frac{2}{3}$ quarts of water to make lemonade for 40

people, how many quarts of lemonade concentrate are needed to make the lemonade for 24 people?

A)
$$\frac{3}{10}$$

B) $\frac{7}{20}$
C) $\frac{2}{5}$
D) $\frac{9}{20}$

3

A machine produced 735 tapes in $5\frac{1}{4}$ hours. What fraction of the 735 tapes was produced in one hour?

A)
$$\frac{1}{7}$$

B) $\frac{4}{21}$
C) $\frac{5}{21}$
D) $\frac{2}{7}$

4

A 32-acre field yields 768 bushels of corn each year. How many more acres are needed to yield 960 bushels of corn each year?

- A) 6
- B) 8
- C) 10
- D) 12

5

The length of a rectangle is 8 inches longer than the width. If the ratio of the length to perimeter is 5:16, what is the area of the rectangle?

- A) 160 in^2
- B) 180 in²
- C) 240 in²
- D) 280 in^2

6

If 12 grams of coffee costs x dollars and each gram makes y cups of coffee, what is the cost of one cup of coffee in terms of x and y?

A)
$$\frac{12y}{x}$$

B) $\frac{y}{12x}$
C) $\frac{12x}{y}$
D) $\frac{x}{12y}$

100

Chapter 6 Practice Test

1

The density of an object is equal to the mass of the object divided by the volume of the object. What is the mass, in grams, of an object with a volume of 0.01 m³ and a density of 4.54 grams per cubic centimeters? (1 m = 100 cm)

- A) 454
- B) 4,540
- C) 45,400
- D) 454,000

2

Jason and Donny painted a house and received \$1,200. To complete the painting job Jason painted 4 hours 25 minutes and Donny spent 2 hours and 15 minutes. If they split the \$1,200 in proportion to the amount of time each spent painting, how much did Donny receive?

- A) \$405.00
- B) \$443.00
- C) \$472.00
- D) \$492.00

3

The tennis balls in a bag are either white or yellow. If the ratio of white balls to yellow balls is $\frac{3}{10}$, which of the following could not be the number of balls in the bag?

- A) 26
- B) 39
- C) 42
- D) 52

4

A car is traveling at a constant rate of x miles per hour. How many miles will the car travel in *y* minutes?

- A) 60*xy*
- B)
- C) 60
- D) $\frac{y}{60x}$

5

A tree is 8 feet tall and grows 8 inches each year. In how many years will the tree reach a height of 30 feet?

- A) 27
- B) 33
- C) 45
- D) 52

6

Aaron reads x pages of a science fiction book in *m* minutes. If he continues reading at this rate, what will be the number of pages he reads in 20 mseconds?

- A) $\frac{1}{3}x$
- B) $\frac{1}{2}x$
- C) $\frac{2}{3}x$
- D) 2x

7

If $\frac{x}{y} = 1$, what is the value of x - y - 1?

- A) -1
- B) 0
- C) 1
- D) The value cannot be determined from the information given.

8

In a certain room the ratio of males to females is 4 to 5. After 8 males enter the room, the ratio of males to females is 6 to 5. What is the total number of people in the room before the additional males enter the room?

- A) 27
- B) 36
- C) 45
- D) 54

9

A person is born every 5 seconds and a person dies every 12 seconds. How many seconds does it take for the population to grow by one person?

A) 7 sec

B)
$$8\frac{4}{7}$$
 sec

C) 10.5 sec

D)
$$10\frac{5}{7}$$
 sec

10

Steve is going to paint a wall that measures 9 feet by 12 feet. If one gallon of paint is needed for each s square foot of wall and each gallon costs gdollars, in terms of s and g how much does it cost to paint the entire wall?

11

If 2 inches are equivalent to 5 centimeters, how many square centimeters are in one square inch?

12

A large painting has a length of 18 inches and a width of 12 inches. If each dimension is reduced by x inches to make the ratio of length to width 5 to 3, what is the value of x?

Answers and Explanations

Section 6-1

1. B

$$\frac{1\frac{3}{4}}{2\frac{1}{2}} = \frac{14}{x}$$
The ratio of $1\frac{3}{4}$ to $2\frac{1}{2}$ is equal
to the ratio of 14 to x.

$$\frac{1\frac{3}{4}}{x} = 14 \cdot 2\frac{1}{2}$$
Cross Products

$$\frac{7}{4}x = 14 \cdot \frac{5}{2}$$
Simplify.

$$\frac{7}{4}x = 35$$
Simplify.

$$\frac{4}{7} \cdot \frac{7}{4}x = \frac{4}{7} \cdot 35$$
Multiply each side by $\frac{4}{7}$.
 $x = 20$
Simplify.

2. D

Let x and y be the two numbers. x + y = 14 The sum of two numbers is 14. . $\frac{x}{y} = -3$. The ratio of the two numbers is -3. $\frac{x}{y} = -3 \implies x = -3y$ x + y = 14First equation(-3y) + y = 14Substitute -3y for x.-2y = 14Simplify.y = -7Substitute y = -7 in the first equation. $x + (-7) = 14 \implies x = 21$ Therefore the product of the two numbers is $x \cdot y = 21 \cdot (-7) = -147$.

3. C

2(x-y) = 3y	
2x - 2y = 3y	Distributive property
2x = 5y	Add $2y$ to each side.
$\frac{2x}{2} = \frac{5y}{2}$	Divide each side by 2.
$x = \frac{5}{2}y$	Simplify.
$\frac{x}{y} = \frac{\frac{5}{2}y}{\frac{y}{y}}$	Divide each side by y .
$\frac{x}{y} = \frac{5}{2}$	Simplify.

4. D

Let 6x = the length and 7x = the width of the rectangle. $P = 2\ell + 2w$ Perimeter of a rectangle. 78 = 2(6x) + 2(7x) P = 78, $\ell = 6x$, and w = 7x78 = 26x Simplify. 3 = x Divide each side by 26. Therefore, the length of the rectangle is $6 \cdot 3$ or 18, and the width of the rectangle is $7 \cdot 3$ or 21. The area of the rectangle is $18 \cdot 21$ or 378.

5. 23

Gas Mileage =
$$\frac{\text{Number of Miles Traveled}}{\text{Number of Gallons of Gas Used}}$$

= $\frac{218.5}{9.5}$ = 23
The car's gas mileage is 23 miles per gallon.

6. 5

Unit Price =
$$\frac{\text{Price of Package}}{\text{Number of Units in the Package}}$$

$$=\frac{0.95}{20}=0.0475$$

The unit price of the vitamin water to the nearest cent is 5.

7. 32.4

Density =
$$\frac{\text{mass}}{\text{volume}}$$

 $\frac{2.7 \text{ grams}}{1 \text{ cm}^3} = \frac{x \text{ grams}}{12 \text{ cm}^3}$
 $x = 2.7 \times 12 = 32.4 \text{ grams}$

Section 6-2

1. D

Set up a proportion.

 $-=\frac{10 \text{ inches}}{x \text{ miles}} \implies x = 50 \text{ miles}$ 1 inch 5 miles $\frac{1 \text{ inch}}{5 \text{ miles}} = \frac{7.2 \text{ inches}}{y \text{ miles}} \implies y = 7.2 \times 5 = 36 \text{ miles}$

The area of the state is 50×36 , or 1,800 mi².

2. B

Let the number of students = 27x and let the number of teachers = 2x. Then, there will be 27x + 2x, or 29x students and teachers who are in the meeting. Now set up a proportion.

$$\frac{\text{total in the meeting}}{\text{number of teachers}} = \frac{29x}{2x} \implies \frac{754}{\text{number of teachers}} = \frac{29x}{2x} \implies \frac{754}{2x} \implies \frac{754 \times 2}{2x} = 52$$

3. B

Let 5x = the volume of cement, 9x = the volume of sand, and 13x = the volume of gravel. Thus the total volume of concrete is 5x+9x+13x, or 27x, which is equal to 324 ft³.

 $27x = 324 \implies x = 12$ Therefore, the amount of cement is $5x = 5 \cdot 12 = 60$.

Cross Products

4. 240

1 hour 45 minutes = $1\frac{3}{4}$ hours Set up a proportion. 84 miles x miles $1\frac{3}{4}$ hours 5 hours $1\frac{3}{4}x = 84 \cdot 5$

 $\frac{7}{4}x = 420$ Simplify. $\frac{4}{7} \cdot \frac{7}{4} x = \frac{4}{7} \cdot 420$ Multiply each side by $\frac{4}{7}$. x = 240

He can drive 240 miles in 5 hours.

5. 8

Let 2x = the number of quarters, 4x = the number of dimes, and 7x = the number of nickels. Then the total amount in terms of x, 2x(0.25) + 4x(0.1) + 7x(0.05), is equal to \$5.00. 2x(0.25) + 4x(0.1) + 7x(0.05) = 5.000.5x + 0.4x + 0.35x = 51.25x = 5x = 4

There are $2x = 2 \cdot 4$, or 8 quarters.

6. 6

$$\frac{5x}{3} = \frac{x+14}{2}$$

$$2(5x) = 3(x+14)$$

$$10x = 3x + 42$$

$$7x = 42$$

$$x = 6$$
Cross Products

7.
$$\frac{5}{12}$$

Let r = the amount of raisin, p = the amount of peanut, and c = the amount of chocolate. Then

$$\frac{r}{p} = \frac{2}{3}$$
The ratio of raisin to peanut is 2:3. $3r = 2p$ Cross Products $p = \frac{3}{2}r$ Solve for p . $\frac{p}{c} = \frac{5}{8}$ The ratio of peanut to chocolate is 5:8 $8p = 5c$ Cross Products $p = \frac{5}{8}c$ Solve for p .

Equate the two equations solved for p.

$$\frac{3}{2}r = \frac{5}{8}c \implies \frac{2}{3} \cdot \frac{3}{2}r = \frac{2}{3} \cdot \frac{5}{8}c$$
$$\implies r = \frac{5}{12}c \implies \frac{r}{c} = \frac{5}{12}$$

Section 6-3

1. A

Set up a proportion.

1240

$$\frac{20}{1240} = \frac{x}{1984} \stackrel{\leftarrow}{\leftarrow} \text{number of machines}}_{\leftarrow}$$

$$\frac{1240x}{1240x} = 20.1984 \qquad \text{Cross Products}$$

$$\frac{20.1984}{1240x} = 222$$

Altogether we need 32 machines, therefore we need 32-20, or 12, more machines.

2 D

Let x = the number of quarts of lemonade concentrate needed for 24 people.

In this question " $6\frac{2}{3}$ quarts of water" was

unnecessary information.

$$\frac{\frac{3}{4}}{40} = \frac{x}{24} \stackrel{\leftarrow}{\leftarrow} \frac{\text{quarts}}{\leftarrow}$$

$$40x = 24 \cdot \frac{3}{4} \qquad \text{Cross products}$$

$$x = 24 \cdot \frac{3}{4} \cdot \frac{1}{40} = \frac{9}{20}$$

3. B

The number of tapes produced in one hour is equal to $735 \div 5\frac{1}{4}$, or 140. The fraction of 735 tapes produced in one hour is $\frac{140}{735}$, or $\frac{4}{21}$.

4. B

Set up a proportion. $\frac{32}{768} = \frac{x}{960} \quad \xleftarrow{\text{number of acres}} \\ \xleftarrow{\text{number of bushels}} \\
768x = 32.960 \qquad \text{Cross products} \\
x = \frac{32.960}{768} = 40$

Altogether we need 40 acres, therefore we need 40-32, or 8, more acres.

5. C

Let x = the width of the rectangle, then x + 8 = the length of the rectangle. $P = 2\ell + 2w$ Perimeter of a rectangle.P = 2(x+8)+2(x) $\ell = x+8$, and w = xP = 4x+16Simplify. $\frac{\text{length}}{\text{perimeter}} = \frac{x+8}{4x+16} = \frac{5}{16}$ 16(x+8) = 5(4x+16)Cross Products16x+128 = 20x+8048 = 4x12 = xThe length of the rectangle is 12+8, or 20 and the width of the rectangle is 12.

The area of the rectangle is $20 \cdot 12$, or 240.

6. D

If 12 grams of coffee cost x dollars, the cost of each gram of coffee is $\frac{x}{12}$ dollars. Let one cup of coffee cost d dollars, and set up a proportion to find the cost of one cup of coffee.

$$\frac{\frac{x}{12}}{y} = \frac{d}{1} \stackrel{\leftarrow}{\leftarrow} \text{cost in dollars} \\ \stackrel{\leftarrow}{\leftarrow} \text{number of cups} \\ y \cdot d = \frac{x}{12} \\ d = \frac{x}{12y}$$
Cross Products

Chapter 6 Practice Test

$$1 m = 100 cm$$

$$1 m^{3} = (100 cm)^{3} = 1,000,000 cm^{3}$$

$$0.01 m^{3} = 0.01 \times 1,000,000 cm^{3} = 10,000 cm^{3}$$

$$Density = \frac{Mass}{Volume}$$

$$4.54 grams / cm^{3} = \frac{Mass}{0.01 m^{3}} = \frac{Mass}{10,000 cm^{3}}$$

$$Mass = 4.54 \frac{grams}{cm^{3}} \cdot 10,000 cm^{3}$$

$$= 45,400 grams$$

2. A

Total time = Jason's time + Donny's time
= 4 hour 25 min + 2 hour 15 min
=
$$4\frac{5}{12}$$
 hour + $2\frac{1}{4}$ hour = $6\frac{2}{3}$ hour

The amount Donny received

$$= 1,200 \times \frac{2\frac{1}{4} \text{ hour}}{6\frac{2}{3} \text{ hour}} = 1,200 \cdot \frac{\frac{9}{4}}{\frac{20}{3}} = 1,200 \cdot \frac{9}{4} \cdot \frac{3}{20}$$
$$= 405$$

If the ratio of white balls to yellow balls is $\frac{3}{10}$,

3n represents the number of white balls and 10n represents the number of yellow balls (*n* is a positive integer).

Since the total number of balls in the bag is 3n+10n, or 13n, and *n* is a positive integer, the number of balls will be a multiple of 13.

Choice C is correct, because 42 is not a multiple of 13.

4. C

Let m = the number of miles traveled in y minutes. Substitute 60 minutes for 1 hour and set up a proportion.

 $\frac{x}{60} = \frac{m}{y} \xleftarrow{} \text{number of miles}}{\xleftarrow{} \text{number of minutes}}$ $60m = xy \qquad \text{Cross Products}$ $m = \frac{xy}{60}$

5. B

Let x = the number of years it will take the tree to reach a height of 30 feet.

Also, 8 inches =
$$\frac{8}{12}$$
 feet .
 $8 + \frac{8}{12}x = 30$
 $\frac{8}{12}x = 22$
 $x = 22 \cdot \frac{12}{8} = 33$
The tree is 8 feet tall and will
grow $\frac{8}{12}x$ feet in x years.

6. A

m minutes = 60*m* seconds Let p = the number of pages he reads in 20*m* seconds. Set up a proportion. $x_{-} p \leftarrow$ number of pages

 $\overline{60m} = \overline{20m} \quad \leftarrow \text{number of seconds}$

$$60m \cdot p = 20m \cdot x \qquad \text{Cross Products}$$

$$p = \frac{20m \cdot x}{60m} = \frac{1}{3}x$$
7. A
$$\frac{x}{y} = 1$$

$$y \cdot \frac{x}{y} = y \cdot 1 \qquad \text{Multiply each side by } y.$$

$$x = y \qquad \text{Simplify.}$$

$$x - y = y - y \qquad \text{Subtract } y \text{ from each side}$$

$$x - y = 0 \qquad \text{Simplify.}$$

$$x - y - 1 = 0 - 1 \qquad \text{Subtract } 1 \text{ from each side.}$$

$$x - y - 1 = -1 \qquad \text{Simplify.}$$

8. B

Let m = the number of males in the room and let f = the number of females in the room.

$\frac{m}{f} = \frac{4}{5}$	The ratio of males to females is 4 to 5.
5m = 4f	Cross Products
$\frac{m+8}{f} = \frac{6}{5}$	After 8 males enter the room, the ratio of males to females is 6 to 5.
5(m+8) = 6f	Cross Products
5m + 40 = 6f	Simplify.
4f + 40 = 6f	Substitute $4f$ for $5m$.
40 = 2f	Subtract $2f$ from each side.
20 = f	Divide each side by 2.

Substituting 20 for f in the equation 5m = 4fgives $5m = 4 \cdot 20$. Solving for m yields m = 16.

The total number of people in the room before the additional males enter the room is m + f = 16 + 20 = 36.

9. B

If a person is born every 5 seconds, 12 people are born per minute. If a person dies every 12 seconds, 5 people die per minute. Every minute the population grows by 12-5, or 7, people.

Therefore, it takes $\frac{60}{7}$ seconds, or $8\frac{4}{7}$ seconds, for the population to grow by one person.

10. D

Total area of the wall = $9 \times 12 = 108 \text{ ft}^2$. Let it take p gallons of paint to paint 108 ft². Set up a proportion. $\frac{1}{s} = \frac{p}{108} \stackrel{\leftarrow}{\leftarrow} \text{number of gallons} \stackrel{\leftarrow}{\leftarrow} \text{number of square feet}$ sp = 108 Cross Products $p = \frac{108}{s}$ It takes $\frac{108}{s}$ gallons of paint to paint 108 ft². Since each gallon costs g dollars, the total cost will be $\frac{108}{s} \cdot g$ dollars. 11. $\frac{25}{4}$ or 6.25 2 in = 5 cm 1 in $= \frac{5}{2}$ cm Divide each side by 2.

$$(1 \text{ in})^2 = (\frac{5}{2} \text{ cm})^2$$
 Square both sides.
 $1 \text{ in}^2 = \frac{25}{4} \text{ cm}^2$ Simplify.

There are $\frac{25}{4}$ square centimeters in 1 square inch.

12.3

The reduced length of the painting is 18-x and the reduced width of the painting is 12-x.

$\frac{18-x}{12-x} = \frac{5}{3}$	The new ratio is 5 to 3.
3(18 - x) = 5(12 - x)	Cross Products
54 - 3x = 60 - 5x	Distributive Property
54 + 2x = 60	Add $5x$ to each side.
2x = 6	Subtract 54 from each side.
<i>x</i> = 3	Divide each side by 2.
